Indian Linguistics

By Shomit Sirohi

I. Linguistics

Linguistics is the study of language and its structures and is also a mathematical notation on it perhaps. Linguistics also means phonemes and graphemes and such phonetics. A style of Indian linguistics therefore is to go abstract and complex and perhaps simplify. It is its type of phonetics.

II. Types of Linguistic Mathematics

I mean then make it mathematical, just derive a mathematical jargon with the phonetic type.

III. Example

A phonetic type –

I heard a person speak abstractly and complexly with Aristotle and Ambedkar as references constantly.

Now develop this process –

“At a high level of abstraction then, in a complex convolute of abstraction, convolute 1 as basic step then is to unfold the process of a convolute, the process is a complex convolute like spandrels and architecture.”
